ABSTRACT

SPRAY OR INJECTION DEVICE ALLOWING AT LEAST TWO PRESET DOSES OF PRODUCT TO BE DELIVERED

The device comprises a casing and a pusher.

According to the invention,

- the casing or the pusher comprises at least one tab able to move radially between a first, normal, radial position, in which the tab does not impede the movement of the pusher with respect to the casing, and a second radial position in which the tab opposes this movement, this tab having an opening;
- the pusher or the casing, respectively, comprises at least one ramp-shaped projection able to bring said tab into said second radial position then to penetrate said opening, thus allowing said tab to return to said first radial position; the pusher or the casing, respectively, further comprises at least one stop region against which the tab abuts when it is brought into said second radial position by said projection, this abutment occurring just before said projection comes opposite said opening.
